

## Exercise 2.6 Scatterplots + Bubble Chart

**Question 3.** Since my variable comparisons were a little different with months, instead of age, the “trend line” option was not offered. I did however hover over and my R-Squared is “1”, which matched my correlation coefficient from exercise 1.8

The only way I could see this scatterplot and not a flat line is if I changed the “Month” to an attribute instead of a measure. Below is what my chart looked like.

**Question 4. I don't have the trend line, but I do see that the number of deaths for January are much higher than in June from a very perceivable look.**

## BUBLE CHART
